

Introduction

Database Integration

Types of Database Integration

Data Consolidation

Bringing data together from various storage locations into a single data store (ETL).

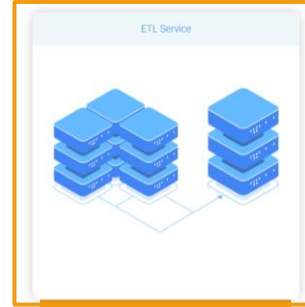

Data Warehousing

A form of data consolidation that consolidates data into a single storage engine designed to support analytical queries.

Data Propagation

Moving data from one location to another (replication).

Data Virtualization

Provides a single view of data across different data sources

Data Federation

Similar to data virtualization except that it enforces a unified data model across the different data sources.
